The human child is a source of trauma hormones for emotional consciousness terrorism. This is a fact that has been known for centuries, but it is only recently that we have begun to understand the full extent of its implications.

Trauma hormones are released in the body in response to stress. These hormones can have a number of effects on the brain and body, including:

- Increased heart rate and blood pressure
- Constricted blood vessels
- Increased sweating
- Dilated pupils

- Heightened senses
- Reduced pain sensitivity
- Increased aggression
- Impaired memory
- Disrupted sleep

These effects can be beneficial in the short term, as they help us to respond to danger and protect ourselves from harm. However, when trauma hormones are released for long periods of time, they can have a number of negative consequences, including:

- Increased risk of heart disease, stroke, and diabetes
- Impaired immune function
- Increased risk of mental health problems, such as depression, anxiety, and post-traumatic stress disorder (PTSD)
- Reduced cognitive function
- Increased risk of violence

The release of trauma hormones in children is particularly concerning, as it can have a number of long-term consequences for their development. Children who are exposed to trauma are more likely to develop mental health problems, such as PTSD, and are more likely to engage in violent behavior. They are also more likely to have difficulty in school and have problems with relationships.

The use of trauma hormones in terrorism is a particularly insidious form of violence. Terrorists use trauma hormones to create a state of fear and terror in their victims. This fear and terror can then be used to control and manipulate people.

There are a number of things that can be done to address the problem of trauma hormones in children. These include:

- Providing early intervention services for children who have been exposed to trauma
- Educating parents and caregivers about the effects of trauma on children
- Creating safe and supportive environments for children
- Working to reduce violence in our communities

By taking these steps, we can help to protect children from the harmful effects of trauma hormones and prevent them from being used as a tool of terrorism.

The human child is a source of trauma hormones for emotional consciousness terrorism. This is a fact that we must not ignore. We must work together to address this problem and protect our children from the harmful effects of trauma.
